### Performance Components of Eco Gard oil filter

**LEAK TESTED** all filters are individually leak tested and date stamped on top of the filter.

**END CAP/ BASE PLATE** plastisol sealant used in all filter end caps to prevent leakage. Sealant is applied in a automated process to guarantee consistent application and performance.

**SEALING GASKET** nitrile sealing gasket is used on all filters to securely seat the filter to the engine block to prevent any leakage.

**FILTER MEDIA** all filter media is designed for the highest filtration efficiency and to withstand any pressure surges or collapsing.

**BASE PLATE** heavy-gauge steel plate for maximum strength. Rolled thread design prevents any metal particles from entering filter during manufacturing process.

**FILTER INBOARD SEAM** double lock seam prevents any leakage between the threaded base plate and filter can.

**SPIRAL CENTER TUBE** tin plated steel is used for maximum flow and structural strength.

**RELIEF-SAFETY VALVE** designed to by-pass oil flow if media element were to be blocked.
